# Inverse and Forward Kinematics of 3R Planner Serial Robot 

Sibsankar Dasmahapatra<br>Assistant Professor, Department of Mechanical Engineering, Kalyani Govt. Engg. College, Kalyani, WB, India. Email - sdmpmekgec@gamil.com

#### Abstract

Robots are replacing human work force to a huge extent. The robots are essential in the modern industries and manufacturing field for precise activities. The study of robotics is now an emerging filed in the research area. The robot has two types of as serial and parallel manipulator. In this work the serial manipulator of 3DOF planner robot has been conisdered. In the present paper, the kinematics modelling of a $3 R$ planner robot has been done for the inverse and forward kinematics. The detailed mathematical modelling of these kinematics equations can help to derive the similar type of mathematical modelling for higher degree of freedom robot. The different set of output value of corresponding kinematics modelling have been tabulated in this work. The set of data available in the tables can be used for the predcition purpose.

Key Words: 3-R Planner Robot, Serial Robot, Inverse kinematics, Forward kinematics.

## 1. INTRODUCTION:

Robots are essential in human beings in every aspect of life. It is replacing human work force to a huge extent. Every kind of industrial applications like production, packaging, logistics etc use the application of robot. So the robotics is one of the most emerging area in the research filed. The study of the analysis and mathematical modelling of the robotics is important. Application of mechanical, electrical, electronics, computer science engineering is seen almost equivalently [1-2] in the study of robotics. The inverse kinematics modelling is helpful to find out the end effector position with help of each link length and movement [2-4]. The forward kinematics modelling supports to extract each link movement with help of the end effector position and each link length [1, 4-5]. The mathematical equations for the higher degree of freedom system is too much complicated that it is not possible to find out the mathematical equation by simple algebraic method. The DH matrix is essential for higher order system to find out the inverse and forward kinematics modelling [5-6]. These modelling of the serial manipulator can help the idea of the parallel manipulator [78] with higher degree of freedom [9-10]. The modern controllers [11-12] will be helpful to control the precise motion of these type of systems. The mathematical modelling will be helpful to get the prior knowledge before real-time experimental works. In this research work, the basic of the 3R planner serial robot has been discussed in the next section. The mathematical modelling of forward and inverse kinematics for 3R serial manipulator have been formulated step by step in the section 3. The different set of values extracted from the inverse and forward kinematics have been tabulated in the section 4. Theses set of values can be used in future for the prediction purpose by ANN methodology [13-15].

## 2. 3R planner robot:

3R Planner manipulator is called 3R because it has 3 revolving links. It has only rotary motion and no linear motions. It is called planner because its motion occurs only in 1 plane. This is a typical manipulator which is the precursors of all types of manipulators. The Fig. 1 depicts the 3R planner manipulator with link length $l_{1}, l_{2}$ and $l_{3}$ of link 1,2 and 3 respectively and $\theta_{1}, \theta_{2}$ and $\theta_{3}$ are angle of $l_{1}$ w.r.t X -axis, $l_{2}$ w.r.t $l_{1}$ and $l_{3}$ w.r.t to $l_{2}$ respectively. The end effector position have been taken here as $\mathrm{X}, \mathrm{Y}$ and $\varphi$

$$
\begin{equation*}
\text { where } \varphi=\theta_{1}+\theta_{2}+\theta_{3} \tag{2.1}
\end{equation*}
$$

X and Y are the coordinate in x and y axis respectively.

Figure 1. 3R serial planner manipulator.

## 3. Mathematical Modelling of Forward and Inverse Kinematics of 3R planner robot Forward Kinematics

In forward kinematic analysis, the angular positions of the links $\theta_{1}, \theta_{2}$ and $\theta_{3}$ are given and the position of the end effector ( $\mathrm{X}, \mathrm{Y}$ ) have to be found out. The $\mathrm{X} \& \mathrm{Y}$-coordinate of the end effector is basically the summation of the X \& Y-coordinates of the individual links, hence

$$
\begin{equation*}
X=X_{l_{1}}+X_{l_{2}}+X_{l_{3}} \tag{2.2}
\end{equation*}
$$

Now from the Fig. 1 it can be written that

$$
\begin{align*}
& X_{l_{1}}=l_{1} \cos \theta_{1}=l_{1} C_{1}  \tag{2.3a}\\
& X_{l_{2}}=l_{2} \cos \left(\theta_{1}+\theta_{2}\right)=l_{2} C_{12}  \tag{2.3b}\\
& \quad X_{l_{3}}=l_{3} \cos \left(\theta_{1}+\theta_{2}+\theta_{3}\right)=l_{3} C_{123} \tag{2.3c}
\end{align*}
$$

Similarly,

$$
\begin{align*}
& Y=Y_{l_{1}}+Y_{l_{2}}+Y_{l_{3}}  \tag{2.4}\\
& Y_{l_{1}}=l_{1} \sin \theta_{1}=l_{1} S_{1}  \tag{2.5a}\\
& Y_{l_{2}}=l_{2} \sin \left(\theta_{1}+\theta_{2}\right)=l_{2} S_{12}  \tag{2.5b}\\
& Y_{l_{3}}=l_{3} \sin \left(\theta_{1}+\theta_{2}+\theta_{3}\right)=l_{3} S_{123} \tag{2.5c}
\end{align*}
$$

So it can be written from (2.2, 2.3a-c) and (2.4, 2.5a-c

$$
\begin{gather*}
X=l_{1} C_{1}+l_{2} C_{12}+l_{3} C_{123}  \tag{2.6a}\\
Y=l_{1} S_{1}+l_{2} S_{12}+l_{3} S_{123} \tag{2.6b}
\end{gather*}
$$

The end effector position can be extracted by using (2.6a) and (2.6b) which are forward kinematics equations.

## Inverse Kinematics:

In inverse kinematics, the position of the end effector $(\mathrm{X}, \mathrm{Y})$ are given and $\theta_{1}, \theta_{2}$ and $\theta_{3}$ have to be found out. Now the forward kinematic equations (2.6a) and (2.6b) can be rewritten as

$$
\begin{align*}
& X-l_{3} C_{123}=l_{1} C_{1}+l_{2} C_{12}=m  \tag{2.7a}\\
& Y-l_{3} S_{123}=l_{1} S_{1}+l_{2} S_{12}=n \tag{2.7b}
\end{align*}
$$

From (2.7a) and (2.7b), it can also be written that

$$
\begin{align*}
& m^{2}+n^{2}=\left(l_{1} C_{1}+l_{2} C_{12}\right)^{2}+\left(l_{1} S_{1}+l_{2} S_{12}\right)^{2}  \tag{2.8a}\\
&=l_{1}^{2}+l_{2}^{2}+2 l_{1} C_{1} l_{2} C_{12}+2 l_{1} S_{1} l_{2} S_{12}  \tag{2.8b}\\
& {\left[\because C_{1}^{2}+S_{1}^{2}=\cos ^{2} \theta_{1}+\sin ^{2} \theta_{2}=1 \text { and } C_{12}^{2}+S_{12}^{2}\right.}\left.=\cos ^{2}\left(\theta_{1}+\theta_{2}\right)+\sin ^{2}\left(\theta_{1}+\theta_{2}\right)=1\right]  \tag{2.8c}\\
& m^{2}+n^{2}=l_{1}^{2}+l_{2}^{2}+2 l_{1} l_{2}\left(C_{1} C_{12}+S_{1} S_{12}\right)  \tag{2.9a}\\
&=l_{1}^{2}+l_{2}^{2}+2 l_{1} l_{2}\left[\cos \theta_{1} \cos \left(\theta_{1}+\theta_{2}\right)+\sin \theta_{1} \sin \left(\theta_{1}+\theta_{2}\right)\right]  \tag{2.9b}\\
&=l_{1}^{2}+l_{2}^{2}+2 l_{1} l_{2} \cos \left(\theta_{1}-\theta_{2}-\theta_{1}\right)  \tag{2.9c}\\
&=l_{1}^{2}+l_{2}^{2}+2 l_{1} l_{2} \cos \theta_{2}  \tag{2.9d}\\
& \cos \theta_{2}=\frac{m^{2}+n^{2}-l_{1}^{2}-l_{2}^{2}}{2 l_{1} l_{2}}
\end{align*}
$$

$$
\begin{equation*}
\theta_{2}=\cos ^{-1} \frac{m^{2}+n^{2}-l_{1}^{2}-l_{2}^{2}}{2 l_{1} l_{2}} \tag{2.10b}
\end{equation*}
$$

Now,

$$
\begin{equation*}
C_{12}=C_{1} C_{2}+S_{1} S_{2} \tag{2.11a}
\end{equation*}
$$

So it can be written with help of (2.7a) and (2.11a) that

$$
\begin{align*}
& m=l_{1} C_{1}+l_{2}\left(C_{1} C_{2}+S_{1} S_{2}\right)  \tag{2.11b}\\
& =C_{1}\left(l_{1}+l_{2} C_{2}\right)-l_{2} S_{1} S_{2}  \tag{2.11c}\\
& S_{12}=S_{1} C_{2}+C_{1} S_{2}  \tag{2.12a}\\
& \text { (2.12a) that }
\end{align*}
$$

Again,

$$
\begin{equation*}
n=l_{1} S_{1}+l_{2}\left(S_{1} C_{2}+C_{1} S_{2}\right) \tag{2.12b}
\end{equation*}
$$

$$
\begin{equation*}
=S_{1}\left(l_{1}+l_{2} C_{2}\right)+l_{2} C_{1} S_{2} \tag{2.12c}
\end{equation*}
$$

Now, by $(2.11 c) \times\left(l_{1}+l_{2} C_{2}\right)+(2.12 c) \times l_{2} S_{2}$

$$
\begin{array}{r}
m\left(l_{1}+l_{2} C_{2}\right)=C_{1}\left(l_{1}+l_{2} C_{2}\right)^{2}-l_{2} S_{1} S_{2}\left(l_{1}+l_{2} C_{2}\right) \\
+\quad n l_{2} S_{2}=l_{2} S_{1} S_{2}\left(l_{1}+l_{2} C_{2}\right)+C_{1}\left(l_{2} S_{2}\right)^{2}  \tag{2.13a}\\
\hline m\left(l_{1}+l_{2} C_{2}\right)+n l_{2} S_{2}=C_{1}\left[\left(l_{1}+l_{2} C_{2}\right)^{2}+\left(l_{2} S_{2}\right)^{2}\right]
\end{array}
$$

So,

$$
\begin{align*}
C_{1} & =\cos \theta_{1}=\frac{m\left(l_{1}+l_{2} C_{2}\right)+n l_{2} S_{2}}{\left(l_{1}+l_{2} C_{2}\right)^{2}+\left(l_{2} S_{2}\right)^{2}}  \tag{2.13b}\\
\theta_{1} & =\cos ^{-1} \frac{m\left(l_{1}+l_{2} C_{2}\right)+n l_{2} S_{2}}{\left(l_{1}+l_{2} C_{2}\right)^{2}+\left(l_{2} S_{2}\right)^{2}} \tag{2.13c}
\end{align*}
$$

Hence using (2.1), (2.10b) and (2.13c) the value of $\theta_{3}$ can be extracted as

$$
\begin{equation*}
\theta_{3}=\varphi-\theta_{1}-\theta_{2} \tag{2.14}
\end{equation*}
$$

The angular movement of each link length can be found out by using (2.10b), (2.13c) and (2.14) which are inverse kinematics equations.

## 4. RESULTS AND DISCUSSION:

### 4.1. Set of Data extracted from the forward kinematics mathematical modelling:

Now the data collecting from equation (2.6a) and (2.6b) for forward kinematics have been tabulated in Table1. In the Table 1 , the given data are $L_{1}, L_{2}, L_{3}$ and $\theta_{1}, \theta_{2}, \theta_{3}$. The corresponding extracted values of X and Y have been tabulated with help of forward kinematic modelling established by (2.6a) and (2.6b).

Theses set of values in Tables 1 and 2 can be used in future for the prediction purpose by ANN methodology [13-15].

## 5. CONCLUSION:

The inverse and forward kinematics mathematical modelling of 3R serial manipulator have been formulated in this present study. The mathematical expressions help to find out the corresponding output values which have been tabulated in this paper work. The tabulated data set will help to predict the kinematics modelling of 3 R robot. The testing and validation data of the prediction process can be taken from the tables. The prediction process ANN can be used in further for the modelling of higher degree of freedom robotic system.
